# DISCOLORED TOOTH

A discolored tooth is a tooth that appears darker than the teeth beside it. Teeth naturally darken as you age, but the overall color of your teeth should be about the same.

## Frequently Asked Questions

#### 1. What causes a Discolored Tooth?

A discolored tooth may be caused by:

- Decay
- Trauma
- Gum recession exposing a dark root
- · A dead or receded nerve in the tooth
- An existing root canal treatment
- An old silver filling which has leeched gray color into the tooth
- An old composite filling which is staining underneath the edges or has discolored over time
- Tooth wear leading to the exposure of the darker layer of tooth under the enamel
- · Stain from food or beverages

Discolored teeth are more common in people who have:

- · Poor oral hygiene
- Periodontal disease
- Existing root canal treatments and old fillings
- Bite problems
- · A smoking habit

### 3. What can I do to minimize my risk of a Discolored Tooth in the future?

Consult your dentist regarding your particular situation. Some options that may be recommended are:

- · Repair decayed teeth
- Treat teeth needing root canal treatments
- · Address exposed tooth roots
- · Replace old fillings
- · Address bite problems
- Bleach the inside of root canal treated teeth or use dental whitening products (at home or in-office)

#### 4. What will happen if I choose to do nothing about my Discolored Tooth?

Unless addressed, the appearance of a discolored tooth can worsen over time. In some cases the discoloration indicates decay or a dead nerve and these can lead to a severe infection or the loss of your tooth.
